

Adapter

Type: Structural

What it is:

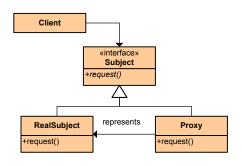

Convert the interface of a class into another interface clients expect. Lets classes work together that couldn't otherwise because of incompatible interfaces.

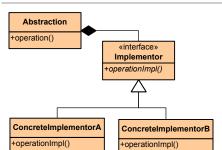

Proxy

Type: Structural

What it is:

Provide a surrogate or placeholder for another object to control access to it.

Bridge

Type: Structural

What it is:

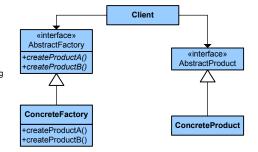

Decouple an abstraction from its implementation so that the two can vary independently.

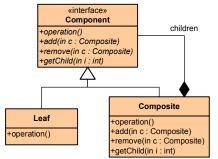

Abstract Factory

Type: Creational

What it is:

Provides an interface for creating families of related or dependent objects without specifying their concrete class.

Composite

Type: Structural

What it is:

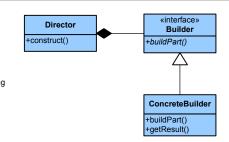

Compose objects into tree structures to represent part-whole hierarchies. Lets clients treat individual objects and compositions of objects uniformly.

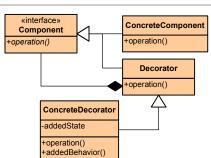

Builder

Type: Creational

What it is:

Separate the construction of a complex object from its representing so that the same construction process can create different representations.

Decorator

Type: Structural

What it is:

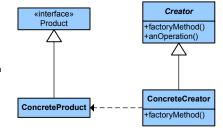

Attach additional responsibilities to an object dynamically. Provide a flexible alternative to sub-classing for extending functionality.

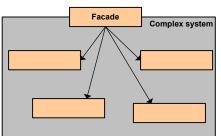

Factory Method

Type: Creational

What it is:

Define an interface for creating an object, but let subclasses decide which class to instantiate. Lets a class defer instantiation to subclasses.

Facade

Type: Structura

What it is

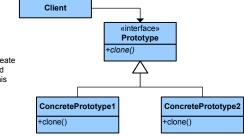

Provide a unified interface to a set of interfaces in a subsystem. Defines a high-level interface that makes the subsystem easier to use.

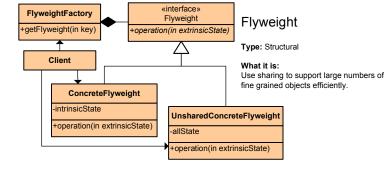

Prototype

Type: Creational

What it i

Specify the kinds of objects to create using a prototypical instance, and create new objects by copying this prototype.

Singleton

Type: Creational

What it is:

Ensure a class only has one instance and provide a global point of access to it.

Singleton

-static uniqueInstance -singletonData +static instance() +SingletonOperation()
